Analysis & Numerical Treatment of Singular IVPs

Part II

O. Koch, P. Kofler and Ewa B. Weinmüller,

Institute for Applied Mathematics and Numerical Analysis,

University of Technology, Vienna, Austria.

Contents

- Singular IVPs
- Implicit Euler method
- Asymtotic error expansion for the approximation computed by the implicit Euler method
- Accelleration technique
  - Zadunaisky's idea
  - Iterated Defect Correction (IDeC)
  - Experimental results
- Conclusion

Singular IVPs

$$\boxed{z'(t) = \frac{M(t)}{t} z(t) + f(t, z(t)),\ t \in (0, 1]}$$

- $M(t) = M + tC(t)$, $C \in C[0, 1]$
- $\lambda(M) : Re(\lambda) < 0$ or $\lambda = 0$
- $f(t, y) \in C([0, 1] \times \mathbb{R}^n)$

$$\boxed{Mz(0) = 0} \qquad (\Longleftrightarrow z \in C[0, 1])$$

- yields rank$(M) = n - m$ equations

$$\boxed{B_0 z(0) = \beta}$$

- $B_0 \in \mathbb{R}^{(m\times n)}$, $\beta \in \mathbb{R}^m$

Singular IVPs – theoretical results

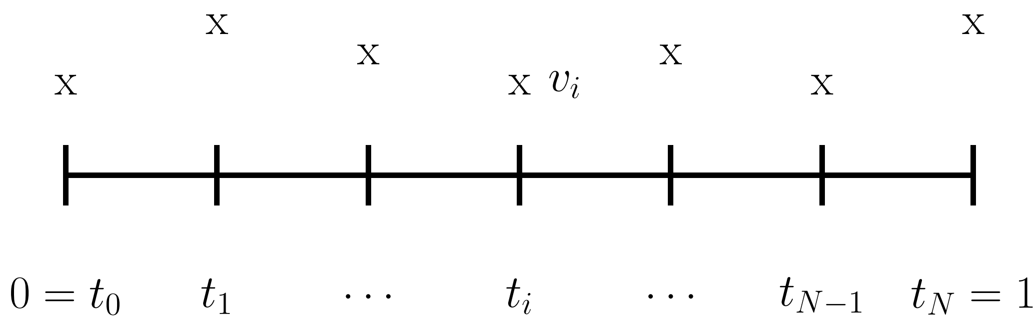
- $C \in C^p[0,1]$, $p \geq 0$
- $f(t,y) \in C^p([0,1] \times \mathbb{R}^n)$,
  Lipschitz-condition with respect to y
- $m \times m$-matrix $B_0 R$ nonsingular,
  R projection onto eigenspace of M
  for eigenvalue $\lambda = 0$

$$\Downarrow$$

existence and uniqueness of solution z

$$z \in C^{p+1}[0,1] \ (p=6)$$

Implicit Euler method



$$\Delta_h = (t_0, t_1, \ldots, t_i, \ldots, t_N),\ N = 1/h$$

$$\begin{cases} \frac{v_i - v_{i-1}}{h} = \frac{M(t_i)}{t_i} v_i + f(t_i, v_i),\ i = 1(1)N \\ B_0 v_0 = \beta \\ M v_0 = 0 \end{cases}$$

$$v_h = (v_0, v_1, \ldots, v_i, \ldots, v_N)$$

$$\Downarrow$$

$$|v_i - z(t_i)| = O(h),\ i = 0(1)N,\ \text{for}\, h \rightarrow 0$$

Asymtotic error expansion

- $v_h = (v_0, \ldots, v_i, \ldots, v_N)$ grid vector solution obtained by implicit Euler method on mesh Δ_h
- we make an ansatz

$$v_i = z(t_i) + \sum_{j=1}^{5} h^j e_j(t_i) + r_i,\ t_i \in \Delta_h$$

- and have to show
  - $\exists\, e_j$ smooth
  - $|r_i| = O(h^6)$, $i = 0(1)N$, for $h \to 0$

Variational equations

singular IVPs

$$\begin{cases} e_1'(t) - \frac{M(t)}{t} e_1(t) = f_y(t, z(t)) e_1(t) + \frac{1}{2} z''(t) \\ e_1(0) = 0 \end{cases}$$

$$\begin{cases} e_2'(t) - \frac{M(t)}{t} e_2(t) = f_y(t, z(t)) e_2(t) + \frac{1}{2} e_1''(t) + \\ \qquad \frac{1}{2} f_{yy}(t, z(t)) e_1^2(t) - \frac{1}{6} z^{(3)}(t) \\ e_2(0) = 0 \end{cases}$$

$$z \in C^7[0,1]$$

$$\Downarrow$$

$$e_1 \in C^6[0,1] \Longrightarrow e_2 \in C^5[0,1]$$

$$\Downarrow$$

e_j smooth for all further j, $3 \leq j \leq 5$

Remainder term

- r_i, $i = 1(1)N$, satisfies

$$\begin{cases} \frac{r_i - r_{i-1}}{h} = \frac{M(t_i)}{t_i} r_i + g(t_i, r_i) + l_i \\ r_0 = 0 \end{cases}$$

- with

$$g(t_i, r_i) := \int_0^1 f_y(t_i, v_i - (1-\tau) r_i)\, d\tau \cdot r_i$$

and $l_i = O(h^6)$

- by a contraction argument we show that there exists an $L < 1$ with

$$|r_i| \leq \text{const} \frac{1}{1-L} |l_i| = O(h^6), \text{ for } h \to 0$$

Zadunaisky's idea

- solve

$$\begin{cases} z'(t) = F(t, z(t)),\ t \in (0,1] \\ z(0) = \beta \end{cases}$$

  by implicit Euler method

- obtain grid vector solution

  $z_h^{(0)} = (z_0^{(0)}, \ldots, z_i^{(0)}, \ldots, z_N^{(0)})$

- interpolate $(t_0, z_0^{(0)}), \ldots, (t_N, z_N^{(0)})$ by polynomial $p^{(0)}(t)$ of degree $m = N$

- solve "neighboring problem"

$$\begin{cases} z'(t) = F(t, z(t)) + p^{(0)\prime}(t) - F(t, p^{(0)}(t)) \\ z(0) = p^{(0)}(0) = \beta \end{cases}$$

Zadunaisky's idea – continued

- obtain grid vector solution $p_h^{(0)}$ by implicit Euler method on the same grid Δ_h
- use known global error $z_h^{(0)} - p_h^{(0)}$ as estimation for the unknown global error of the original problem
- accuracy by the heuristic argumentation
- implementation:
  - continuous function $p^{(0)}(t)$ composed of polynomials with degree $m < N$

Iterated Defect Correction (IDeC)

- improve approximation

$$z_h^{(1)} := z_h^{(0)} + (z_h^{(0)} - p_h^{(0)})$$

- interpolate $(t_0, z_0^{(1)}), \ldots, (t_N, z_N^{(1)})$ by new polynomial $p^{(1)}(t)$

- solve "neighboring problem" with defect

$$p^{(1)\prime}(t) - F(t, p^{(1)}(t))$$

- obtain grid vector solution $p_h^{(1)}$ by implicit Euler method on the same grid Δ_h

- improve approximation again

$$z_h^{(2)} := z_h^{(0)} + (z_h^{(1)} - p_h^{(1)})$$

IDeC – expectations

$\surd$ practical basis for IDeC:

Zadunaisky's and Stetter's idea

$$n := \min(m, 6)$$

$$|z_{i_h^*}^{(j-1)} - z(t_*)| = O(h^j), \text{ for } 1 \le j \le n$$

$$|z_{i_h^*}^{(j-1)} - z(t_*)| = O(h^n), \text{ for } j > n$$

$\surd$ theoretical basis for IDeC:

asymtotic error expansion

"Emden differential equation"

$$\begin{cases} z'(t) = \frac{1}{t}\begin{pmatrix} 0 & 1 \\ 0 & -1 \end{pmatrix} z(t) - t \begin{pmatrix} 0 \\ z_1^5(t) \end{pmatrix} \\ z(0) = (1,0)^T \end{cases}$$

Conclusion

- order sequence is $O(h), O(h^2), O(h^3), \ldots$ as expected
- IDeC is very efficient

$$\Downarrow$$

further investigations:

- Is imlicit middle-point rule $O(h^2)$?
- Exists an asymtotic error expansion?
- Has the IDeC the order sequence $O(h^2)$, $O(h^4)$, $O(h^6), \ldots$?
